SUMMARY

First-year CS student (Computing concentration) targeting AI engineering with a computer vision focus. Builds AI products end to end — product direction, frontend, and applied LLM integration — validated through a national AI hackathon finalist placement.

PROJECTS

ClearHead — AI Cognitive Load Manager

USAII Global AI Hackathon 2026

Frontend, UI/UX & Product Lead (2-person team) · github.com/Nan0dev06/ClearHead

- Led product direction and built the full frontend for an AI-powered productivity assistant that turns vague goals into structured, milestone-based plans and tracks real-time distraction during work sessions.
- Designed "Shape an Idea," a guided planning flow that asks clarifying questions to reshape task pacing and break goals into editable sub-tasks — built to justify AI-driven planning over static templates, the core weakness flagged by judges.
- Built Focus Guard, a Chrome Extension (Manifest V3) that tracks on-page distraction and feeds a live cognitive-load score into an animated companion UI.
- Chose and specified the AI approach — selecting Qwen2.5-72B (Hugging Face) and Llama-3.3-70B (Groq) and defining how each model's output should drive the planning flow — while a teammate handled backend/API wiring; iterated post-submission on file-grounded reasoning to surface why the model made each planning decision.
- Scored 72/100 in the qualifying round; named hackathon finalist.

Stack: React, Vite, FastAPI, Qwen2.5-72B, Llama-3.3-70B, Chrome Extension (Manifest V3)

Café Lumière — Coffee Shop Management System

CSCI207: Object-Oriented Programming

3-person team · github.com/Nan0dev06/Coffee_Shop_Managment_System

- Designed and built a Java Swing desktop application for small-business café management, covering order entry, inventory, and revenue reporting.
- Owned the CoffeeShopSystem and RevenueSummary classes and their UI screens; contributed to the class hierarchy (abstract MenuItem → HotDrink/ColdDrink, Customer, Order, Inventory) and file-based persistence in place of a database.

Stack: Java, Swing, file serialization

Terminal Portfolio — SSH-Native Personal Site

Personal project

Solo · github.com/Nan0dev06/terminal-portfolio

- Built a personal portfolio as a terminal UI instead of a website: visitors connect with a single ssh command and the portfolio renders live inside their own terminal, no browser involved.
- Wrote the SSH backend from scratch using asyncssh, bridging keystrokes and screen output through a Linux PTY into a Textual TUI process per connection.
- Generated an ASCII portrait from a photo with Pillow, and shipped six switchable color themes plus an animated, typing-effect intro.
- Packaged for two deployment paths — a systemd service on a bare Ubuntu VM, and a Docker/Fly.io container mapping port 22 to a containerized SSH endpoint.

Stack: Python, Textual, asyncssh, Pillow, Docker, Fly.io

EDUCATION

USAL University — B.S. Computer Science, Computing Concentration

Expected 2029

Current GPA: 3.6

SKILLS

Languages	Java, Python, JavaScript
Frameworks / Tools	React, Vite, FastAPI, Java Swing, Git
AI / ML	LLM API integration (Hugging Face, Groq), prompt-driven planning systems
Deployment	Docker, Fly.io, Chrome Extension (Manifest V3)

LEADERSHIP

Model United Nations — Best Delegate, AUB MUN 2025.
